REACH US

02 · THE OPPORTUNITY

Executive Summary

We build e-commerce websites and digital solutions for small and medium-sized businesses. We help businesses launch online stores, manage products and orders, integrate payments, and improve their online customer experience.

CLIENT CHALLENGE & BUSINESS CONTEXT

Many small businesses want to move online but don't have the technical knowledge or resources to build and manage a professional e-commerce system. We make the process simpler, faster, and more affordable.

Proposed Solution: Success for NovaCart Technologies means becoming a trusted technology partner for small and medium-sized businesses rather than simply being a website development company.

In the short term, success means consistently acquiring qualified customers, understanding their requirements correctly, delivering projects on time, staying within the agreed budget, and maintaining high customer satisfaction. We want every project to have a clear process from the first lead through requirement collection, proposal, development, testing, payment, launch, and post-launch support.

From a business perspective, we want to increase qualified leads, improve our lead-to-customer conversion rate, increase recurring revenue from maintenance and support, reduce project delays, and improve profitability on every project. We also want to reduce the amount of repetitive manual work involved in managing leads, customer communication, payments, tasks, and project updates.

From a customer perspective, success means our customers can launch their online business quickly, receive a professional digital product, generate more sales or leads, and easily understand what is happening throughout the project. Customers should not have to repeatedly contact us to ask about project status, pending tasks, payments, or deadlines.

From a team perspective, success means every employee clearly understands their responsibilities, priorities, deadlines, and dependencies. Designers, developers, testers, and project managers should be able to work from one connected system instead of relying on scattered WhatsApp messages, spreadsheets, emails, and manual follow-ups.

Ultimately, we want the business to become increasingly data-driven and automated. The system should help us identify the most valuable leads, recommend the next action, detect delayed projects, remind customers about pending payments, create tasks from requirements, summarize customer conversations, and provide

management with a real-time view of business performance.

We would consider the business successful when we can handle more customers without increasing administrative work at the same rate, deliver projects faster and more consistently, retain customers for long-term relationships, generate predictable recurring revenue, and make important decisions using reliable business data rather than assumptions.

12 Capabilities

APPROVED PROJECT FEATURES

03 · CONTEXT

About the Client

NovaCart Technologies operates in the E-commerce & Retail space.

Target customer profile: Our customers are small businesses, retailers, D2C brands, local businesses, and startups that want to sell their products online..

Key business differentiator: We provide an end-to-end solution instead of only developing a website. We combine e-commerce development, payment integration, automation, analytics, and ongoing support in one service..

Design & brand direction: Minimal.

04 · WHAT SUCCESS LOOKS LIKE

Objectives

The project is designed to accomplish the following strategic objectives:

OBJECTIVE 01: INCREASE REVENUE

Increase revenue

Business Need: Eliminate manual friction and establish a unified operational workflow.

Success Indicator: End-to-end customer journey works A customer can discover a product, view its details, add it to the cart, checkout, pay successfully, and receive an order confirmation without manual intervention. **Complete order lifecycle works** Orders can move correctly through Pending → Confirmed → Packed → Shipped → Out for Delivery → Delivered, with appropriate status updates. Inventory remains accurate Successful orders automatically update inventory and the system prevents purchases when available stock is insufficient. **Payments are reliably synchronized** Successful, failed, cancelled, and refunded payment events are correctly reflected against the relevant order. **Shipping integration works** A shipment can be created, tracking information stored, and delivery-status updates synchronized with the corresponding order. Admin can operate the business Administrators can manage products, inventory, customers, orders, payments, shipping, discounts, and basic reporting without developer assistance. **Customer accounts work** Customers can securely register/login, manage their profile and addresses, view order history, and track current orders. **Notifications work** Customers receive appropriate email/WhatsApp/SMS notifications for important events such as order confirmation, payment confirmation, shipment, delivery, and payment-related updates. **Business data is connected** Customer, product, inventory, order, payment, shipping, and communication records are linked rather than stored as isolated records. **Analytics provide actionable information** Management can see important business metrics such as sales, orders, customers, inventory, conversion, and payment status from the dashboard. **Responsive experience** Core customer and admin workflows work correctly on desktop, tablet, and mobile devices. **Security requirements are satisfied** Authentication, authorization, sensitive information handling, API credentials, and administrative access follow appropriate security practices. **Data migration is validated** Approved existing data is migrated, deduplicated, mapped correctly, and verified before the old workflow is retired. **External integrations are resilient** Temporary API failures, timeouts, or unavailable third-party services do not cause data corruption or break the entire application. **Testing is completed** Critical user journeys pass functional, integration, security, and user-acceptance testing with no unresolved critical defects. **Production deployment is successful** The system is deployed to the production environment with monitoring, backups, logging, error handling, and rollback procedures in place. **Business team can use the system independently** Non-technical staff can perform normal day-to-day operations without requiring developers for routine actions.

Requirement REQ-01

OBJECTIVE 02: AUTOMATE OPERATIONS**Automate operations**

Business Need: Eliminate manual friction and establish a unified operational workflow.

Success Indicator: Measurable reduction in operational turnaround time.

Requirement REQ-02

OBJECTIVE 03: IMPROVE CUSTOMER EXPERIENCE**Improve customer experience**

Business Need: Eliminate manual friction and establish a unified operational workflow.

Success Indicator: Measurable reduction in operational turnaround time.

Requirement REQ-03

OBJECTIVE 04: REDUCE MANUAL WORK**Reduce manual work**

Business Need: Eliminate manual friction and establish a unified operational workflow.

Success Indicator: Measurable reduction in operational turnaround time.

Requirement REQ-04

OBJECTIVE 05: LAUNCH A NEW PRODUCT**Launch a new product**

Business Need: Eliminate manual friction and establish a unified operational workflow.

Success Indicator: Measurable reduction in operational turnaround time.

Requirement REQ-05

OBJECTIVE 06: GROW TO NEW MARKETS**Grow to new markets**

Business Need: Eliminate manual friction and establish a unified operational workflow.

Success Indicator: Measurable reduction in operational turnaround time.

Requirement REQ-06

Success criteria:

01 End-to-end customer journey works A customer can discover a product, view its details, add it to the cart, checkout, pay successfully, and receive an order confirmation without manual intervention. Complete order lifecycle works Orders can move correctly through Pending → Confirmed → Packed → Shipped → Out for Delivery → Delivered, with appropriate status updates. Inventory remains accurate Successful orders automatically update inventory and the system prevents purchases when available stock is insufficient. Payments are reliably synchronized Successful, failed, cancelled, and refunded payment events are correctly reflected against the relevant order. Shipping integration works A shipment can be created, tracking information stored, and delivery-status updates synchronized with the corresponding order. Admin can operate the business Administrators

can manage products, inventory, customers, orders, payments, shipping, discounts, and basic reporting without developer assistance. Customer accounts work Customers can securely register/login, manage their profile and addresses, view order history, and track current orders. Notifications work Customers receive appropriate email/WhatsApp/SMS notifications for important events such as order confirmation, payment confirmation, shipment, delivery, and payment-related updates. Business data is connected Customer, product, inventory, order, payment, shipping, and communication records are linked rather than stored as isolated records. Analytics provide actionable information Management can see important business metrics such as sales, orders, customers, inventory, conversion, and payment status from the dashboard. Responsive experience Core customer and admin workflows work correctly on desktop, tablet, and mobile devices. Security requirements are satisfied Authentication, authorization, sensitive information handling, API credentials, and administrative access follow appropriate security practices. Data migration is validated Approved existing data is migrated, deduplicated, mapped correctly, and verified before the old workflow is retired. External integrations are resilient Temporary API failures, timeouts, or unavailable third-party services do not cause data corruption or break the entire application. Testing is completed Critical user journeys pass functional, integration, security, and user-acceptance testing with no unresolved critical defects. Production deployment is successful The system is deployed to the production environment with monitoring, backups, logging, error handling, and rollback procedures in place. Business team can use the system independently Non-technical staff can perform normal day-to-day operations without requiring developers for routine actions.

05 · BUSINESS IMPACT

Problem & Solution

A structured comparison of the current operational state versus the target operating environment:

CURRENT STATE (PROBLEM)

Many small businesses want to move online but don't have the technical knowledge or resources to build and manage a professional e-commerce system. We make the process simpler, faster, and more affordable.

Impact: Reduced operational throughput, potential communication gaps, and inconsistent audit trails.

PROPOSED STATE (SOLUTION)

Success for NovaCart Technologies means becoming a trusted technology partner for small and medium-sized businesses rather than simply being a website development company.

In the short term, success means consistently acquiring qualified customers, understanding their requirements correctly, delivering projects on time, staying within the agreed budget, and maintaining high customer satisfaction. We want every project to have a clear process from the first lead through requirement collection, proposal, development, testing, payment, launch, and post-launch support.

From a business perspective, we want to increase qualified leads, improve our lead-to-customer conversion rate, increase recurring revenue from maintenance and support, reduce project delays, and improve profitability on every project. We also want to reduce the amount of repetitive manual work involved in managing leads, customer communication, payments, tasks, and project updates.

From a customer perspective, success means our customers can launch their online business quickly, receive a professional digital product, generate more sales or leads, and easily understand what is happening throughout the project. Customers should not have to repeatedly contact us to ask about project status, pending tasks, payments, or deadlines.

From a team perspective, success means every employee clearly understands their responsibilities, priorities, deadlines, and dependencies. Designers, developers, testers, and project managers should be able to work from one connected system instead of relying on scattered WhatsApp messages, spreadsheets, emails, and manual follow-ups.

Ultimately, we want the business to become increasingly data-driven and automated. The system should help us identify the most valuable leads, recommend the next action, detect delayed projects, remind customers about pending payments, create tasks from requirements, summarize customer conversations, and provide management with a real-time view of business performance.

We would consider the business successful when we can handle more customers without increasing administrative work at the same rate, deliver projects faster and more consistently, retain customers for long-term relationships, generate predictable recurring revenue, and make important decisions using reliable business data rather than assumptions.

Outcome: Seamless collaboration, complete operational transparency, and client-ready digital delivery.

06 · WHAT IS INCLUDED AND WHAT IS NOT

Scope

Core deliverables and capabilities specified in this proposal.

Third-party license fees and infrastructure hosting costs outside project scope.

Features & Capabilities

The following capabilities have been verified from the client requirement snapshot:

Products & Catalogue

Approved capability specified in client requirements.

- Full administrative & operational access

SOURCE REQ-011

Shipping & delivery

Customers enter or select their delivery address during checkout. The system determines the available shipping options based on the customer's location, product availability, order value, weight, and applicable shipping zone.

After payment is successfully completed, the order is created and assigned for fulfillment. The operations team prepares the order and creates a shipment through the selected shipping provider.

The system should store the shipping provider, shipment ID, tracking number, shipping cost, estimated delivery date, and current delivery status.

Customers should be able to see their order status from their account and receive notifications when the order is confirmed, packed, shipped, out for delivery, and delivered.

If a shipment fails, is delayed, or is returned, the system should record the event and allow the operations/support team to take appropriate action.

- Full administrative & operational access

PRIORITY SHOULD HAVE

SOURCE REQ-012

08 · ENGINEERING APPROACH

Technical Architecture

The solution is architected for enterprise security, high throughput, and zero external data leaks:

LAYER	TECHNOLOGY	PURPOSE
Frontend / UI	Next.js & React	Responsive, high-density professional user interface
Backend / API	Node.js Server Engine	Role-based business logic, state machines & validation
Database & Storage	Prisma & SQLite/PostgreSQL	ACID transactions, audit trails & relational integrity
AI Copilot Engine	Local Qwen3:8B via Ollama	Private, on-premise document & workflow intelligence
PDF Generation	Server-side pdfmake & pdf-lib	Pixel-perfect client-ready PDF document rendering
Delivery & Security	Token-hashed Secure Links & SMTP	Tamper-evident client delivery with access revocation

09 · WHAT WILL BE BUILT

Deliverables

Summary deliverable matrix for this engagement:

DLV-001

PLANNED

Products & Catalogue

Delivered as a production-grade verified system module.

Acceptance Criteria: Passes role permission testing and client review sign-off

DLV-002

PLANNED

Inventory management

Delivered as a production-grade verified system module.

Acceptance Criteria: Passes role permission testing and client review sign-off

DLV-003

PLANNED

Reporting & analytics

Delivered as a production-grade verified system module.

Acceptance Criteria: Passes role permission testing and client review sign-off

DLV-004

PLANNED

Multi-vendor marketplace

Delivered as a production-grade verified system module.

Acceptance Criteria: Passes role permission testing and client review sign-off

DLV-005

PLANNED

Email & SMS notifications

Delivered as a production-grade verified system module.

Acceptance Criteria: Passes role permission testing and client review sign-off

DLV-006

PLANNED

Coupons & discounts

Delivered as a production-grade verified system module.

Acceptance Criteria: Passes role permission testing and client review sign-off

DLV-007

PLANNED

Reviews & ratings

Delivered as a production-grade verified system module.

DLV-011

PLANNED

Payments

Delivered as a production-grade verified system module.

Acceptance Criteria: Passes role permission testing and client review sign-off

DLV-012

PLANNED

Shipping & delivery

Customers enter or select their delivery address during checkout. The system determines the available shipping options based on the customer's location, product availability, order value, weight, and applicable shipping zone.

After payment is successfully completed, the order is created and assigned for fulfillment. The operations team prepares the order and creates a shipment through the selected shipping provider.

The system should store the shipping provider, shipment ID, tracking number, shipping cost, estimated delivery date, and current delivery status.

Customers should be able to see their order status from their account and receive notifications when the order is confirmed, packed, shipped, out for delivery, and delivered.

If a shipment fails, is delayed, or is returned, the system should record the event and allow the operations/support team to take appropriate action.

Acceptance Criteria: Passes role permission testing and client review sign-off

10 · WHEN THIS WILL HAPPEN

Timeline

Target launch window: 3–6 months.

01 Discovery & Solution Design

Phase 01

Requirement baseline confirmation, UX wireframing, architecture validation, and data modeling.

02 Core Platform Development

Phase 02

Frontend interfaces, backend business rules, database schemas, and integration pipelines.

03 Verification & Security Review

Phase 03

Comprehensive testing, role permission validation, and acceptance sign-off.

04 Deployment & Production Launch

Phase 04

Production provisioning, user onboarding, live verification, and delivery handover.

11 · WHO IS INVOLVED

Roles & Responsibilities

Stakeholders and project owners will be confirmed at kickoff.

12 · HOW WE STAY IN SYNC

Communication

Primary contact: Arjun Kumar (Founder & CEO).

Regular progress reviews will be conducted at the end of each delivery phase.

13 · BUDGET & COMMERCIAL TERMS

Investment

Budget model: Fixed price.

Phase / Deliverable	Scope Breakdown	Amount
Platform Architecture & Discovery	Discovery, UI/UX structure and database schema	₹1,25,000
Core Platform Implementation	Feature modules, backend engine & workflow automation	₹2,50,000
Testing, Deployment & Handover	Security verification, QA, launch & documentation	₹1,25,000
		Total Investment ₹5,00,000

The budget should be tied to the agreed scope, acceptance criteria, integrations, and delivery milestones rather than treated as an unrestricted development budget.

We prefer a fixed-price engagement for the defined MVP scope, with payments released against clearly defined milestones and accepted deliverables.

The initial budget should cover requirements analysis, UX/UI design, architecture, frontend and backend development, database implementation, authentication, admin functionality, payment integration, shipping integration, notifications, analytics, testing, deployment, and initial data migration.

Any major functionality introduced after scope approval should go through a formal change-request process. The impact on cost, timeline, dependencies, and existing functionality should be explained before approval.

Third-party costs such as payment-gateway transaction fees, cloud hosting, domain registration, SMS/WhatsApp charges, premium API subscriptions, and other external service charges should be separated from the development budget.

We would prefer milestone-based billing—for example, requirements/design completion, core development, integrations, testing/UAT, and production launch—with final payment linked to successful acceptance criteria.

14 · ENGAGEMENT TERMS

Terms & Working Agreement

1. Scope Governance: Any changes to approved requirements will be managed via structured Change Requests.
2. Intellectual Property: All custom code, designs and project deliverables transfer to the client upon milestone settlement.
3. Confidentiality: Both parties agree to protect proprietary data under mutual non-disclosure terms.

15 · AUTHORIZATION

Proposal Acceptance

By approving this proposal, both parties agree to the scope, timeline, investment and terms outlined in this document.
